Class Diagram for the Online Blackjack Game

Learn to create a class diagram for the Blackjack game using the bottom-up approach.

We'll cover the following

- Components of Blackjack
 - Card
 - Deck
 - Shoe
 - Hand
 - Players
 - Blackjack controller
 - Blackjack game view
 - Blackjack game
 - Enumerations and custom data types
- Relationship between the classes
 - Association
 - Aggregation
 - Composition
 - Inheritance
- Class diagram for the Blackjack game
- Design pattern

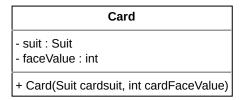

We'll create the class diagram for the Blackjack game. In the class diagram, we will first design the classes, and then identify the relationship between classes according to the requirements for the Blackjack game problem.

Components of Blackjack

In this section, we'll define the classes for the Blackjack game. As mentioned earlier, we are following the bottom-up approach to designing a class diagram for the Blackjack game.

Card

Card belongs to a suit and has a face value. The face value of the card is according to the card number. For example, if we have a number card 5, its face value is also 5. The face value for the King, Queen, and Jack is 10, and 1 or 11 for the Ace, depending on the situation.

The class diagram of the Card class

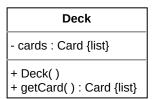

ିଠ୍- R3: Blackjack Game

R3: Every card has points associated with it. The criteria to calculate the face value of the card is as follows:

Card	Face value
Ace	1 or 11
From 2 to 10	Equals the card number
Face cards (King, Queen, Jack)	10

Deck

Deck has 52 cards of four suits, and one suit contains nine number cards (2–10) and four face cards (King, Queen, Jack, and Ace). The Deck class contains a list of cards where the top card is in the first index.

The class diagram of the Deck class

R2: Blackjack Game

R2: The deck will consist of 52 cards in four suits, where each suit contains 13 cards: Ace, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Jack, Queen, and King.

Shoe

Shoe is a device to hold multiple Deck, and it has a shuffle operation.

Shoe - decks : Deck {list} - numberOfDecks : int + Shoe(int numberOfDecks, Deck decks) + createShoe() : void + shuffle() : void + dealCard() : Card

The class diagram of the Shoe class

R1: Blackjack Game

R1: The Blackjack game contains the shoe of cards which contains one or more decks of cards in it.

Hand

The Hand class represents a Blackjack hand used in this game which can contain multiple cards.

Hand
- cards : Card {list}
+ Hand(Card card1, Card card2) + getScore(): int + addCard(Card card)

The class diagram of the Hand class

R8, R9, and R10: Blackjack Game

R8: The player can draw the additional card if their hand has less than 21 points.

R9: The dealer can draw an additional card if their hand is less than 17.

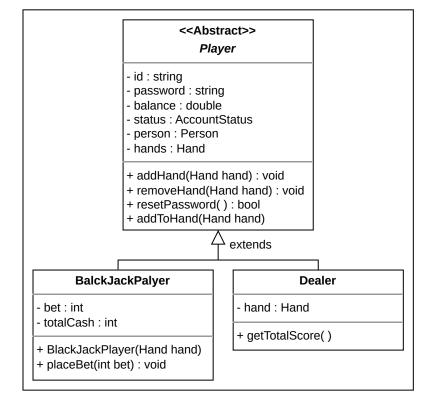

R10: If a player or the dealer's hand is more than 21, they bust and lose the game.

Players

Player is an abstract class. There are two types of players: BlackjackPlayer and Dealer. These classes can be derived from the Player class.

BlackjackPlayer: They place the first wager and update the stake with winning and losing sums. They can choose between hit and stand options.

Dealer: They are primarily in charge of dealing cards and following the Blackjack rules.

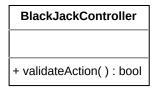

The class diagram of Player and its derived classes

R4: There can be two types of users that can play the Blackjack game, i.e., dealer and the player.

Blackjack controller

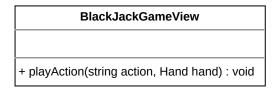

The BlackjackController class validates the action(hit, stand) and responds accordingly.

The class diagram of the BlackjackController class

Blackjack game view

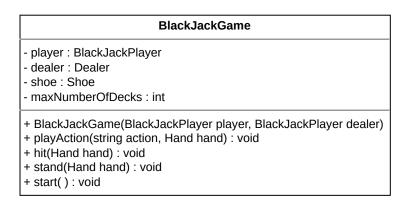

The BlackjackGameView class represents the game view. The BlackjackGame class updates the BlackjackGameView class.

The class diagram of the BlackjackGameView class

Blackjack game

The BlackjackGame class represents how we can play this game or its basic sequence of play. It controls the game, accepts wagers from players, and distributes cards from the Shoe to hands, updates the game's status, gathers lost wagers, pays winning wagers, divides hands, and responds to player decisions to hit or stand.

The class diagram of BlackjackGame class

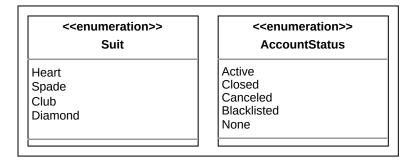

R1: Blackjack Game

R1: The Blackjack game contains the shoe of cards which contains one or more decks of cards in it.

Enumerations and custom data types

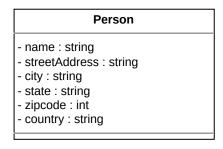

The following provides an overview of the enumerations and custom data types used in this problem:

- Suit: We need to create an enumeration to keep track of the suit of the card, whether it is diamond, spade, heart, or club.
- AccountStatus: We need to create an enumeration to keep track of the account status, whether it is active, canceled, closed, blocked, or none.

Enums in the Blackjack game

 Person: Used to store information related to a person like a name, street address, country, etc.

The class diagram of the Person class

Relationship between the classes

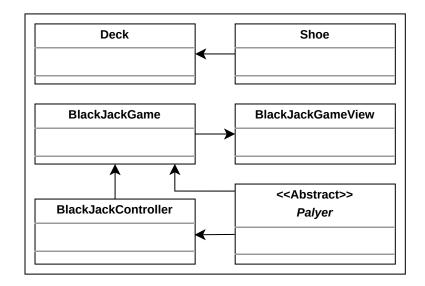

Now, we'll discuss the relationships between the classes we have defined above in our Blackjack game.

Association

The class diagram has the following association relationships:

- The Shoe class has a one-way association with Deck.
- The BlackjackGame class has a one-way association with BlackjackGameView.
- The BlackjackController class has a one-way association with BlackjackGame.

• The Player class has a one-way association with BlackjackGame and BlackjackController.

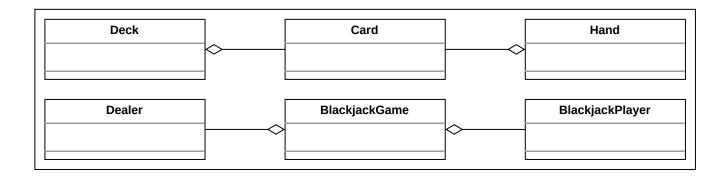

The association relationship between classes

Aggregation

The class diagram has the following aggregation relationships.

- The BlackjackGame class contains the Dealer and BlackjackPlayer.
- Both the Deck and Hand classes contain the Card class.

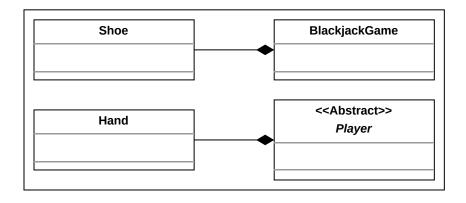

The aggregation relationship between classes

Composition

The class diagram has the following composition relationships.

- The BlackjackGame class is composed of Shoe.
- The Player class is composed of Hand.

The composition relationship between classes

Inheritance

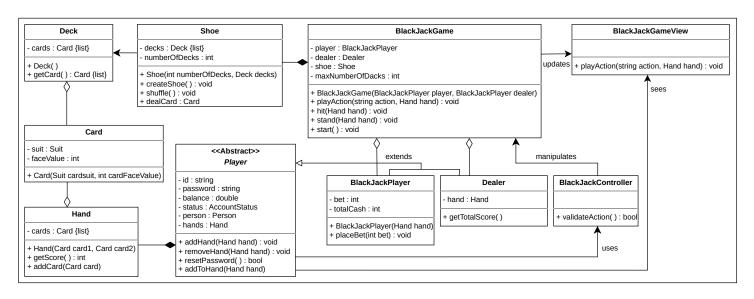

The following classes show an inheritance relationship:

• Both the BlackjackPlayer and Dealer classes extend the Player class.

Note: We have already discussed the inheritance relationship between classes in the component section above one by one.

Class diagram for the Blackjack game

Here's the complete class diagram for our Blackjack game:

The class diagram of the Blackjack game

Design pattern

The Iterator design pattern can be applied, since cards are assigned to the players from the deck of cards by just iterating through the list of cards.

We can also use the State design pattern for our online Blackjack game because this game has a finite number of states. Some of these states are as follows:

- Shuffle the deck
- Draw a card and give it to the dealer
- Draw a card and give it to the player
- Deal cards
- Player hit
- Player stand

We have completed the class diagram of the Blackjack game according to the requirements. Now, let's design the activity diagram of the Blackjack game in the next lesson.
